

Display Property — Made Easy

A practical cheat sheet for understanding how elements appear and arrange themselves.

1. Display Properties at a Glance

DISPLAY	WHAT HAPPENS
block	New line + takes the full available width
inline	Stays in the same line; width and height don't work normally
inline-block	Stays in the same line + width and height work
none	Completely removed from the page
flex	Arranges items in a flexible row or column
grid	Arranges items in rows and columns

2. Easy Way to Remember

BLOCK

↓

New line + full width

INLINE

↓

Same line + width/height don't work normally

INLINE-BLOCK

↓

Same line + width/height work

NONE

↓

Completely disappears

FLEX

↓

Flexible row / column layout

GRID

↓

Rows + columns layout

3. 📌 Most Important: Block vs Inline vs Inline-Block

	BLOCK	INLINE	INLINE-BLOCK
New line?	Yes	No	No
Full width?	Yes	No	No
Width / height?	Works	Doesn't work normally	Works
Best for	Sections / containers	Text / small elements	Buttons / small boxes

4. Quick Code Examples

```
/* Block */
.box {
  display: block;
}

/* Inline */
.box {
  display: inline;
}

/* Inline-block */
.box {
  display: inline-block;
}

/* Hide completely */
.box {
  display: none;
}

/* Flex layout */
.container {
  display: flex;
}

/* Grid layout */
.container {
  display: grid;
}
```

Remember: [display](#) mainly controls how an element participates in the page layout and how its surrounding elements interact with it.
