

CSS Position Property

BEFORE vs AFTER — visual box comparison

1. position: static

Normal/default positioning. The element stays in normal document flow.

BEFORE / NORMAL

Visual idea — exact movement depends on the surrounding HTML/CSS.

AFTER / POSITION APPLIED

2. position: relative

The element moves from its original position using top, right, bottom or left; its original space remains.

BEFORE / NORMAL

Visual idea — exact movement depends on the surrounding HTML/CSS.

AFTER / POSITION APPLIED

3. position: absolute

The element is removed from normal flow and positioned relative to the nearest positioned parent.

BEFORE / NORMAL

Visual idea — exact movement depends on the surrounding HTML/CSS.

AFTER / POSITION APPLIED

4. position: fixed

The element is positioned relative to the browser viewport and stays there while scrolling.

BEFORE / NORMAL

Visual idea — exact movement depends on the surrounding HTML/CSS.

AFTER / POSITION APPLIED

5. position: sticky

The element behaves normally until a scroll threshold is reached, then sticks to that position.

BEFORE / NORMAL

Visual idea — exact movement depends on the surrounding HTML/CSS.

AFTER / POSITION APPLIED

Quick Memory

STATIC	Normal position
RELATIVE	Move from where it normally is
ABSOLUTE	Position relative to a parent
FIXED	Position relative to the screen
STICKY	Normal → sticks while scrolling
